

eGov Agent | Government services through one conversation

eGovPH is already great. eGov Agent makes it easier: tell it what you need, and it uses the government connections that already exist, asks before acting, and gives you clear proof when the job is done.

1 THE SIMPLE FLOW

2 THE HEURISTICS TIER SAVES MONEY

1	FAST RULES	Known requests	78% · <10 ms · ~P0
2	LOCAL AI	Taglish + data extraction	17% · ~120 ms · ~P0.02
3	CLOUD AI	Hard planning; private fields removed	5% · 1-3 s · ~P1.50

The router starts with the cheapest safe option and moves up only when confidence is low. The percentages and prices are planning assumptions for the prototype.

- Heuristics tier: simple rules answer known requests and status checks almost instantly.

Local AI: understands Taglish and pulls fields from text while private data stays on government infrastructure.

Cloud AI: used only for hard planning; names, IDs and other private fields are removed first.

3 PERSONAL, BUT USER-CONTROLLED

- Memory keeps approved facts and preferences so people do not repeat the same details. Every fact needs a source and an edit/delete option.

The Vault stores encrypted documents and shows friendly file-stamp previews when a form needs an attachment.

Long tasks can run in a temporary private machine. It is created for one job, returns the files, then is wiped.

4 WHAT THE PROTOTYPE PROVES

STATUS	WHAT IT MEANS
Working now	Chat, live artifacts, file previews, uploads, memory, vault and printable results
Simulated	eVerify, agency records, appointments, eGovPay/eReceipt and eReport routing
Still needed	Live agency APIs, backend, database, job queue, credentials and payment callbacks

5 GENERATIVE UI (ARTIFACTS)

- The agent does not answer with text alone. It builds the right interface inside the conversation. We call each generated result an artifact.
- Review cards and pre-filled forms before anything is submitted.

File-stamp previews for IDs, certificates, photos and uploaded documents.

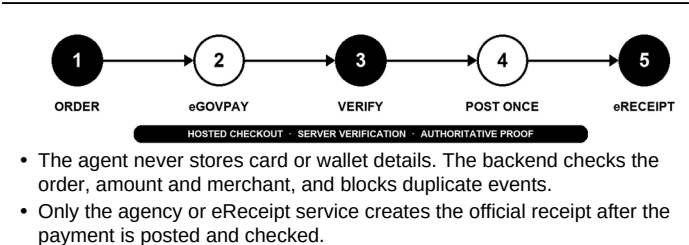

eReport triage, responder status, appointment passes, payment cards and print-ready eReceipts.

WHY IT MATTERS Less reading, fewer screens and a clear result people can save or print.

6 AGENTIC, WITH CLEAR GUARDRAILS

7 eGOVPAY TO VERIFIED eRECEIPT

8 A PRACTICAL PILOT

WINDOW	DELIVERABLE
0-6 weeks	Rules, privacy review, service maps and connector plans
6-12 weeks	Read-only data checks, identity, consent and test connections
12-24 weeks	Pilot payments, eReceipts, reports and human help
6-12 months	2 national agencies + 1 LGU; security and wider rollout

Rough 9-12 month planning range: PHP 18.0M-33.5M for two national agencies, one LGU and up to 50,000 monthly users. This is not a vendor quote.

- Targets: at least 95% correct routing, no duplicate high-impact actions, at least 99.95% payment matching and WCAG 2.2 AA.

Before launch: Privacy Impact Assessment, security testing, agency approval and a human path for uncertain or high-risk cases.

OFFICIAL BASIS

eGovPH Core (core.e.gov.ph) · eGovPay (egovpay.gov.ph) · PSA National ID eVerify (psa.gov.ph; everify.gov.ph) · Data Privacy Act and NPC Circular 2023-06 (privacy.gov.ph) · RA 11032 (lawphil.net)

RECOMMENDATION Start with a small sandbox pilot. Keep agencies in control, ask before every important action, and confirm every result from the official source.
